3Key Controller + 5050 RGB LED Strip

Change headphone settings android. How do i change the headphome setting on my android. Headset setting in android phone. How to earphone settings on android. Cara setting headphome di android.

Image not available forColor: To view this video download Flash Player One of the first things most people do when they purchase a new smartphone is add their Google account. Let's face it: Gmail is probably the most-used email platform on the planet, and many of us even have several addresses to separate work from personal life. By default, most Android phones require you to log in to a Google Account to use Google's services, which carries over to Gmail, Google Calendar, and whatnot. On Apple devices, you must manually add the account in the settings to access these services through the native apps. If you don't, you can simply sign in through the stand-alone Gmail app. This guide shows you how to set up a Gmail account in Android and iOS using the system settings and through the Gmail app. Add a Google account in iOS and iPadOS With Apple devices, you can add a Google account to access its services in native apps like Mail, Contacts, and so on. This is different than installing the Gmail app and signing in to your Google account. The following instructions apply to the former. Step 1: Tap to open the Settings app. Step 2: Scroll down and tap Mail. Step 3: Tap Accounts on the following screen. Step 4: Tap Add Account. Step 5: Tap the big colorful Google logo. You can't miss it. Step 6: Tap Continue on the pop-up window to allow the Settings app to access google.com. Step 7: Enter your Google account address or phone number and then tap Next. Step 8: Enter your Google account password and then tap Next. Step 9: Enable and disable everything you want to sync, and then tap Save located in the top-right corner. If you just want to access your Gmail account without adding Google's services to your Apple device, use the stand-alone app instead. Just sign in to your Google account, and you're good to go. If you need to add a second Google account to the Gmail app, scroll down to the final set of instructions. Add a second Google account in Android The situation with Android is that, in contrast to iPhones, not all devices have identical interfaces. That plays a role in the beauty and the curse of an open-source platform that permits personalization. This means that any directions and guidance we offer may not resemble what you see on your device. Because of this, we provide instructions for stock Android 11 (Pixel phones) and Samsung phones with Android 10. Because we have to believe your Android phone is already signed in to your primary Google account, provided that this step is imperative when setting up the device, we teach you how to add a secondary account through the device settings. Once that lesson is complete, we'll open the Gmail app and add that second account if you didn't decide to add it using the device settings method. Stock Android 11 Step 1: Drag a finger down from the top to fully expand the Notification Shade, and then tap the Cog icon. This opens the Android settings panel. Step 2: Scroll down and tap Accounts. Step 3: Tap Add Account on the following screen. Step 4: Tap Google. Step 5: Verify your identity by using your face, finger, or PIN. Step 6: Enter your Google account address and then tap Next. Step 7: Enter your Google account password and then tap Next. Step 8: Tap I Agree on the Google Terms of Service screen. Step 9: If prompted, add a credit card for purchases or tap No Thanks. Once finished, you will be returned to Accounts in Settings. If you want to see the accounts that you have added or want to delete any, just tap Google. Samsung phones (Android 10) Step 1: Drag a finger down from the top to fully expand the Notification Shade, and then tap the Cog icon. This opens the Android settings panel. Step 2: Tap Accounts and Backup. Step 3: Tap Accounts. Step 4: Tap Add Account. Step 5: Tap the Google option on the list. Step 6: Enter your PIN if prompted. Step 7: Enter your Google account address and then tap Next. Step 8: Enter your Google account password and then tap Next. Step 9: Tap I Agree on the Google Terms of Service screen. Step 10: If prompted, add a credit card for purchases or tap No Thanks. Once finished, you will be returned to Accounts in Settings. If you want to see the accounts that you have added or want to delete any, just tap Google. Use the Gmail app These directions only apply to you if you've added your second Google account to an Android device, but it's not showing up in the Gmail app. The subsequent directions also apply to Apple devices if users prefer not to add a second Google account through the device's Settings but still want to get into their Gmail. In this case, we assume you previously downloaded the app, logged in to your primary Google account, and need to join another account. Step 1: Tap to open the Gmail app. Step 2: Tap your Google Account icon in the top-right corner. Step 3: Tap Add Another Account in the drop-down panel. Step 4: Tap Google on the following screen. Step 5: Tap Continue on the pop-up window to allow the app to access google.com. Step 6: Enter your Google account address or phone number and then tap Next. Step 7: Enter your Google account password and then tap Next. Step 8: Tap I Agree on the Google Terms of Service screen. Step 9: If prompted, add a credit card for purchases or tap No Thanks. Editors' Recommendations Unbalanced headphones have a number of causes, but are also easy enough to fix with a few simple, easy-to-learn tweaks. Have you ever used your headphones and noticed that one side is louder than the other? You've tried adjusting the audio jack, unplugging it or twisting it around with no such luck. This can be especially frustrating when one side delivers a full spectrum of quality melodies while the other is slightly muted or completely quiet. You might be thinking about ditching your headphones for a new pair, but don't throw them out just yet. The good news? Balancing your headphones' sound is often a simple fix away, regardless of whether you're using a PC or an Android. Check out this simple guide to restore balance to your uneven headphones. Often, the issue lies with one of your audio channels, where the signal is transported from the audio source to the speakers. The signal is split between the left and right channel of the headphones, which usually results in the same amount of sound for both speakers. However, when there is a deficit in the flow of this signal, this gives the impression that your headphones are unbalanced. Most headphones work by using either mono or stereo audio channels. Mono means 'one', with the signal being sent using only one channel. Stereo, on the other hand, uses two different channels with respective sounds sent to the left and right channels. When one channel is over- or under-utilized, sounds are split between the channels and this gives the impression that your music is unbalanced. Unbalanced audio channels can be due to the following reasons: Unbalanced audio channels can commonly occur from altered equalizer (EQ) settings. When more current is directed to one speaker over another, frequencies are compromised and the effect is a seemingly unbalanced audio experience. Computers have specialized sound effects that are programmed to alter the perception of music coming from the sound card. These are found in the Control Panel and emphasize either a mono or stereo sound effect. Connecting your headphones to the wrong output can cause unbalanced channels and sound. Nowadays, this issue is less common as most commercial audio devices are adaptive and can detect input devices. If you're curious as to whether your headphones are in sync with your device's channels, use this helpful left / right stereo test to check their sound balance. On a PC, you can check how your audio channels are used via the 'Sound' section of the Control Panel. A few simple tweaks here can drastically change the way that your headphones produce sound. Check that your speakers are balanced equally A difference in the sound of your headphones may be as a result of an incorrect 'Left' / 'Right' balance. That is, either the left or right headphone is louder than the other. To check and solve this, do the following: Open the 'Control Panel'. Search for 'Sound' and select it. Search for 'Sound' and select it. Right-click on your headphones, select 'Properties'. Right-click on your headphones, select 'Properties'. Click on the 'Levels' tab. Click on the 'Levels' tab. Click the 'Balance' button to the right of your device. Click the 'Balance' button to the right of your device. Restore the balance so that it is equal, or, adjust the balance until your speakers sound the same. This simple fix is highly effective in altering the left / right balance of most headphones. However, it often goes unchanged because it's a little difficult to find. Disable any special sound effects that might be affecting playback As mentioned earlier, Windows PCs come with unique sound-enhancing features. These features affect headphone playback, so these could be causing

your altered sound perception. To solve this, you can disable all the sound effects to simply restore audio to normal. Open the 'Control Panel'. Search for 'Sound' and select it. Right-click on your headphones, select 'Properties'. Click on the 'Enhancements' tab. Click on the 'Enhancements' tab. Click the 'checkbox' labelled 'Disable all sound effects'. Click the 'checkbox' labelled 'Disable all sound effects'. Disabling all sound effects removes different playback sounds, enabling mono audio to keep channels equal. This removes a '3D' sound effect, but can quickly restore the balance to your headphone audio by assigning sound to both channels equally. Unbalanced headphones can occur from using the wrong jack. If you only hear from the left headphone speaker, you might be using an audio device with mono output capability or a 'mono' jack. To solve this, try the following: A headphone port will be labeled 'headphones', or there will be a headphone icon on the device. This means that your headphones will get stereo sound and will sound the same in both ears. Headphones should be plugged in a headphone jack as plugging it in an earphone jack will only create sound in the left headphone. If you're more interested in learning about headphone jacks in detail, check out our great Headphonesty guide on Headphone Jack and Plugs. If one earphone is louder than the other in your Android device, your Accessibility settings might be to blame. These are similar to the sound features on Windows devices, assigning audio via mono or stereo channels for enhanced listening. To check whether these settings have been enabled or not, try the following: Head to 'Settings'. Head to 'Settings'. Select 'Accessibility'. Select 'Accessibility'. There, you should find a slider to shift speaker balance either left or right. If this doesn't work, you can also check the 'Mono Audio' feature. This will return sound via both channels equally, removing a stereo effect but enabling equal playback. You can also check the 'Mono Audio' feature. Changing your accessibility settings on your Android phone can balance the audio of your headphones by adjusting the 'Left' / 'Right' volume balance or enabling Mono Audio. Do note that changing these settings won't make your Android headphones louder than they are capable of. If they're inherently low-volume or have a volume limiter, your best bet is just to get a new pair. Conclusion By now, you've restored the sound to your headphones and are listening to your music, audiobooks or movies with a fully-balanced, out-of-this-world audio experience. Or, you've learned about the intricacies of channel playback and understood how both PCs and Android devices have certain built-in features that alter the way that playback happens. Either way, we hope you're able to enjoy your balanced headphones without worrying about having to buy a new pair. Are your headphones now balanced? Did you manage to find the problem that was causing your playback to sound distorted? Were the changes you made minor or major? Please comment down below!
